

I am very concerned and disturbed by the current plan to implement BPL. While I understand the issue of people wanting to make a living and the need for high speed Internet access in areas that are not supported by present day DSL and CABLE, I am very concerned for the impact the RF radiation generated by BPL will have on such things as Emergency communications and other commercial traffic that takes place in the HF and VHF bands.

There is also another issue that sounds like it is being overlooked in this case. If BPL is implemented, what will be the results when licensed services such as Amataur Radio, transmit within their licensed portion of spectrum causing disruption of BPL services?

When there is the current option of Broadband Internet service via Satelite for those people who live in areas not accessable by DSL or Cable, why is it so necessary to do so much potential damage to so many other services, potentially world wide?
